JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

The list of game birds contains not only descriptions and other information of value to the general reader and sportsman, but a discussion of the distribution of each species in the State including a large number of original records. The report forms another valuable addition to the literature of West Virginian ornithology and a work that can be consulted with profit by anyone interested in the history of American game birds, either from the point of view of the sportsman or the naturalist. A number of interesting photographs illustrate Mr. Brooks' paper the most noteworthy from an ornithological standpoint being a set of four eggs of the Duck Hawk on a ledge on the Great Cacapon River and a nest with three eggs of the Mourning Dove.— W. S.

Forbush's recent Bulletins on Economic Biology.— The Massachusetts State Board of Agriculture has recently issued a valuable Bulletin on 'The Natural Enemies of Birds,'¹ by Edward Howe Forbush, State Ornithologist. The balance of nature, a matter that is too often ignored in the present day enthusiasm for bird protection, is first considered, and then follows a detailed discussion of the several classes of bird enemies; mammals — domestic and wild; birds and reptiles.

Mr. Forbush rightly divides bird enemies into two groups "(1) Those introduced from foreign countries and which therefore tend to disturb the balance of nature, and should be eliminated so far as possible except when under control, either in domestication or in captivity. Such are the dog, house rat, ferret, cat, hog, ox, horse, sheep and goat, English Sparrow and Starling. (2) The native natural enemies, which have through thousands of years become perfectly adjusted in their relation to the species on which they prey. These should not be eliminated, with the exception of those few that threaten our lives or our material welfare, but should be conserved and controlled according to our needs. When a species becomes too numerous it should be reduced in numbers, if too few it should be allowed to increase."

The ninth annual report of the State Ornithologist² presents much matter of interest to those who are trying to interest the public in methods of practical bird protection, while another edition of Mr. Forbush's admirable Bulletin on 'The Domestic Cat'³ testifies to the demand for this publication and the awakening of the public mind to a serious consideration of the cat question. Arrangements have been made to supply this Bulletin to Audubon societies which may desire it for distribution.— W. S.
